Email live-demo workshop — every customer email, every input combination

Written 2026-10-30. Every test below is a REAL send triggered the way staff trigger it — no rendered previews. Use one demo customer whose email is yours, so nothing reaches a real customer. Staff Bcc (store + HQ) still receive copies; warn them.

Side effects to clean up afterwards: demo orders flow into loyalty, the MTO PO queue, recon and the accounts digest (the middleware has no test-order exclusion). Cancel each demo order with **Notify customer UNTICKED** (or the cancellation email fires), archive, and list the order numbers so loyalty entries can be reversed.

---

0. Before the workshop — what is actually live

Shopify's API cannot read notification templates, so "what is live" = what admin holds and what the last real send looked like. As of today:

Template (Settings → Notifications)	Live copy (from admin, 2026-10-30)	Repo copy	Status
Draft order invoice (advance receipt)	= repo	`templates/Strategy/email_draft_order_invoice.html`	Same. Payment method prints blank for card/UPI (see A3)
Order confirmation	**pre-10-Oct version**	`templates/Strategy/email_order_confirmation.html`	**Live copy has no tag routing — §1 shows the result**
Shipping confirmation	pre-10-Oct version	`templates/Strategy/email_shipping_confirmation.html`	Live ignores `ch:offline` tag; reads the metafield only (works, since metafields exist by shipping time)
Refund	new design	`templates/refund-confirmation.liquid` (older)	Last real send (30 Sept, #1023) was the OLD one: blank amount, phone 7738868305. Logo has the left-align bug; width 600 fixed

Resend (after-sales) logo/phone-width fix: deployed in commit 71dbe86.

Decision needed before installing the order confirmation — see §1.3.

---

1. Order flow — the inputs and what they do

1.1 The inputs (Metafield Manager → Required Inputs, on the DRAFT)

Panel field	Metafield	Tag the panel writes on save	Read by
Order Type	`custom.order_type`	`ot:in-stock` / `ot:mto`	Advance receipt (metafield). Order confirmation ignores it by design
Channel	`custom.channel`	`ch:online` / `ch:offline`	Advance receipt (metafield) — phone only; Order conf (tag, repo version only); Shipping conf (metafield)
Ship to Customer	`custom.shipment`	`ship:yes` / `ship:no`	Order conf (tag, repo version only)
Send Tax Invoice in Email	`custom.in_store_sale`	adds/removes `in-store-sale`	Order conf (tag, both versions)

Why tags: Shopify sends the order confirmation ~2s after the draft converts; the middleware copies `custom.*` onto the order 4–20s later. The confirmation can only see what the DRAFT carried — tags. History: #1073 (in-store-sale typed on the order after conversion → wrong email; led to the toggle, 1 Sept), #1075 (in-store sale got the online "on its way" email because the template read blank metafields; led to ch:/ot:/ship: tags, 10 Oct — **never installed in admin**).

1.2 Order confirmation — every combination (metafields blank at send, as in production)

Columns: Subj+ = subject "…here's your tax invoice"; Btn = Download Tax Invoice; Body; 21d = "usually shipped within 21 business days"; View = View order; Wts = gross/net/dia weights; Ship = shipping row + shipping address + Shipping Policy link; Phone.

LIVE template (what customers get today):

Channel	Ship	Tax-inv toggle	Subj+	Btn	Body	21d	View	Wts	Ship	Phone
any	any	**No**	–	–	"preparing your order… on its way"	✓	✓	–	✓	938
any	any	**Yes**	✓	✓	"preparing your order… on its way"	–	✓	–	–	938

Channel and Ship to Customer have **no effect at all**. Every offline sale without the toggle gets the full ONLINE email (no tax invoice, 21-day shipping promise, shipping charges row). With the toggle it gets a hybrid: tax-invoice subject and button, but online body, View order, no weights, online phone. **The offline-delivery email ("dispatched in 2 to 3 business days") is unreachable.**

REPO template (tag routing, not yet installed):

Channel	Ship	Tax-inv toggle	Result	Notes
online	any	No	ONLINE	correct
online	any	**Yes**	OFFLINE PICKUP (no body, weights, 968, no shipping)	toggle forces offline even on a web order

Channel	Ship	Tax-inv toggle	Result	Notes
offline	yes	No	OFFLINE DELIVERY ("dispatched in 2 to 3 business days", Tax Invoice, shipping row + address + policy, 968)	correct
offline	yes	**Yes**	OFFLINE PICKUP	**delivery copy lost** — staff read "Send Tax Invoice = Yes" as harmless
offline	no	Yes / No	OFFLINE PICKUP	correct; toggle irrelevant — the invoice is sent either way
offline	blank	Yes / No	OFFLINE PICKUP	blank Ship is treated as pickup
blank	any	No	ONLINE	an offline sale with Channel unset gets the online email
blank	any	Yes	OFFLINE PICKUP	

1.3 Decision needed — the toggle overlaps Channel

In the repo version the Tax-invoice toggle only matters in two places and is wrong in both (online+Yes → pickup email; offline+delivery+Yes → delivery copy lost). Offline already sends the tax invoice without it. Recommended rule set — one input decides one thing:

- **Channel** decides online vs offline. Offline always carries the tax invoice.
- **Ship to Customer** decides pickup vs delivery (offline only).
- **Send Tax Invoice in Email** is retired from routing (or, if kept, only shows/hides the button and never changes body or shipping copy).
- Channel and Ship to Customer must be filled before conversion. Today "required" is display-only (an asterisk); nothing stops a blank conversion.

This is a template logic change → needs hunks shown and approved before anything goes to admin.

1.4 Shipping confirmation — combinations (metafields present by then)

Channel (metafield)	Toggle	Subject	Btn	Body	Phone
Online	any	"…here's your tax invoice"	✓	"packed with care… tax invoice and tracking below"	938
Offline	any	"…here are your tracking details"	–	"…tax invoice was sent earlier with your payment confirmation"	968
blank	any	online variant	✓	online	938

Both versions behave the same. Note the chain: today an offline sale with the toggle off got NO invoice in its confirmation (§1.2) and the shipping email then says "your tax invoice was sent earlier" — **the customer never receives the invoice.**

1.5 Three questions answered

Online checkout orders — who sets Channel = Online? Nobody, and nothing needs to. A web order never passes through a draft, so it carries no `ch:` tag, and no middleware code writes `custom.channel` on it (only loyalty reads `source_name`). The template treats "not marked offline" as online: the online branch is the

default. There is no advance receipt for web orders (that email is the Draft order invoice, sent only from drafts); the order confirmation is the payment confirmation — "Your Timanti order #… confirmed", totals, GST, payment method. The shipping confirmation then falls to its online variant (Tax Invoice button) for the same reason. Risk: the default is online, so any OFFLINE draft that reaches conversion without `ch:offline` looks like a web order.

Why "Ship to Customer has no effect" — and #1075. The field was added for exactly the right reason. The problem is where the live template reads it from: `order.metafields.custom.shipment`. That metafield reaches the order 4–20s AFTER the email, so it is always blank at send time. The live template reads Channel the same way, so on #1075 Channel read blank → online branch → body "we are preparing your order and will notify you when it is on its way" + "Items are usually shipped within 21 business days". Note the live template has no in-store-sale branch in the BODY: even with Send Tax Invoice = Yes, that "on its way" sentence still prints. The repo template reads `ship:` / `ch:` TAGS, which are on the draft before conversion — that is the version where Ship to Customer works. It was written 10 Oct and never pasted into admin.

MTO handed over at the second payment. Order Type does NOT change the order confirmation in either version (`is_mto` is assigned in the live file and never used). So leaving the draft as MTO cannot produce "being made / gone to the workshop / wait" copy — and should be left as MTO, because procurement sync uses order_type for the PO-queue tab. The "wait / shipped" wording a handover customer sees today comes from the online default described above. With the repo template, a handover = **Channel Offline + Ship to Customer No** → "Thank you for your purchase!", Tax Invoice button, weights, no greeting sentence, no timeline, no shipping row/address/policy, phone 968 — identical for MTO and in-stock. Two MTO traps remain:

- If the balance is collected with **Send invoice** (draft invoice) instead of converting, the advance-receipt template DOES read Order Type, and prints "Made to order pieces take up to 21 business days" on a piece being handed over. Collect the final payment by converting, or switch Order Type before sending — confirm the effect on the PO queue first.
- Ship to Customer left blank is treated as pickup (safe for handover); Channel left blank is treated as online (wrong for handover). Channel must be enforced.

1.6 Phone numbers

Confirmed by the founder 2026-10-30: **7710938305 for online, 7710968305 for offline** — both are correct and intentional. Check each email shows the number for its channel. Resend after-sales emails use 968 (store-led flows).

---

2. Test cards — order flow

For each: set the inputs on the draft in Metafield Manager, **Save** (tags are written on save), then act. Check the draft's Tags box shows the expected `ch:/ot:/ship:/in-store-sale` before converting.

A1 Advance receipt — in-stock. Inputs: Order Type in-stock, Channel Offline, Installment 1 amount

- mode. Action: More actions → Send invoice. Expect: subject "Your Timanti Order Advance Receipt"; no order-number line; item name + qty only; single "Advance received" line = installment total; balance note; "Download Advance Receipt"; **no** 21-day box; phone 968.

A2 Advance receipt — MTO. As A1 with Order Type mto. Expect the "Made to order pieces take up to 21 business days" box under the button. Everything else identical to A1.

A3 Advance receipt — payment method. Run A1 with mode UPI, then Card. Known bug: Payment method prints **blank** (template matches bare `upi` / `card` tags; middleware now writes `pmodes:upi`). Cash works by accident. Fix is in the order confirmation already (copy the `pmodes:` block).

A4 Advance receipt — edge. Channel unset → phone flips to 938. Installment not entered → no "Advance received" line but the balance note still prints. Staff must save the panel before Send.

O1 Online. Option A: real storefront checkout with a single-use 100% code (₹0 totals) or a ₹1 product via UPI. Option B: draft with Channel Online, Mark as paid — valid only once the repo template (tag routing) is installed. Expect: subject "Your Timanti order #… confirmed"; "Hi {name}, we are preparing your order…"; View order; certificate note; no weights; 21-day timeline; Shipping row; shipping + billing address; Shipping Policy link; phone 938.

O2 Offline pickup. Channel Offline, Ship No. Mark as paid. Expect: subject adds "here's your tax invoice"; Tax Invoice button; no greeting body; weights; no timeline/View order/shipping row/shipping address/Shipping Policy; phone 968.

O3 Offline delivery. Channel Offline, Ship Yes, toggle **No**. Expect: "your piece will be dispatched to you in 2 to 3 business days"; Tax Invoice; weights; timeline; Shipping row + address; Shipping Policy; 968.

O4–O6 Combination checks (run the cells marked bold in §1.2 to show the problem live): O4 offline+delivery+toggle Yes; O5 online+toggle Yes; O6 offline with Channel blank.

S1 Shipping — online. Fulfil O1 with tracking number + carrier, Notify customer ticked. Expect: no order line; "Your order is on the way!"; Tax Invoice button; one orange tracking line "Tracking Number: X (Carrier)"; GST breakup; weights incl. dia ct; 938.

S2 Shipping — offline. Fulfil O3 the same way. Expect: subject "…here are your tracking details"; no Tax Invoice button; "tax invoice was sent earlier…"; 968.

S3 Edge. Carrier left blank → prints "Tracking Number: X ()". Don't use Edit tracking to re-test — that sends the *Shipping update* template, not Shipping confirmation. Don't re-fire on real customers' orders; fulfil a demo order.

R1 Refund (Shopify). Refund a demo order with Notify customer ticked. Expect the new design: "Refund request confirmation — #…", amount, method, item table, 4-week line, 968. Check the logo is centred on a phone.

---

3. Test cards — after-sales (Resend)

All from `hello@timanti.in`. Repair drafts are driven by tags + HQ forms.

#	Email	Trigger	Look for
R1	Received	tag `repair-intake` (needs an order reference; outside pieces need inspection)	"Repair ID: #D…"; no name/fault/timeline; item table with "Gross weight at receipt" if intake weight was entered. Internal intake email to store/HQ
R1b	Complimentary	`free-repair` (panel) or HQ estimate form with free=true	Old-style email (green banner) — only v1 email still sent. Known: item reads "repair" (draft line title); no item table

#	Email	Trigger	Look for
R2	Estimate	HQ estimate form submit	Breakdown rows; total; Approve & Pay Now / Approve & Pay at Store / WhatsApp; "10 to 15 days… link valid 30 days"
R3a	Confirmed — paid online	pay the GoKwik link	"Amount received" = estimate; "could be higher or lower" note. Internal Payment Received with Mark Complete link
R3b	Confirmed — pay at store	tag `repair-store-approved`	"Payment will be collected when you pick up"; "Estimated charges"
R4a	Ready — refund (paid, final lower)	HQ Mark Complete with lower Final Repair Cost	Estimated / Final / Refund due (green); wallet vs original-method choice
R4b	Ready — balance (paid, final higher)	higher final cost	Balance payable (red); pay-now link + pay at store
R4c	Ready — pay at store	path R3b, then complete	**Known bug:** "Estimated charges" shows the FINAL figure, not the original estimate
R4d	Ready — complimentary	complete a free repair	**Known risk:** final cost 0 is read as blank → falls back to the draft price → customer asked to pay
R4e	Tracking vs pickup	enter a Sequel ID or leave blank	Tracking link only with a Sequel ID; pickup customers still see "tracking details will follow"
V1	Voucher	Exchange Calculator → Create Voucher & Tag Order	Subject "Your Timanti Voucher — Rs.X | Code: VCH-…" (value unformatted, e.g. Rs.28400); code/valid-until/value; 9 terms
V2	Voucher expiry	daily sweep, 30 days before `cn-exp:`	Fires once per day window; guard is in-memory → a deploy that day re-sends
V3	Exchange note	applied to a new draft (`/api/exc-email`)	"Value deducted"; "not a credit for future use"; 9 conditions
V4	Draft refund	MFM refund button (`send-refund-email`)	Full vs partial copy; paid / refunded / pending rows

Check every Resend email on a phone: logo centred, no horizontal clipping (fixed in 71dbe86).

---

4. Known problems, ranked

1. **Live order confirmation ignores Channel and Ship to Customer** — every offline sale gets online wording; offline-delivery copy unreachable; invoice never sent when toggle is off. Fix: install the repo template after the §1.3 decision.
2. **Tax-invoice toggle conflicts with Ship to Customer** (repo version): Yes on a delivery order drops delivery copy; Yes on an online order sends the store email. §1.3.
3. **Required inputs are not enforced** — blank Channel → online email; blank Ship → pickup.
4. **Advance receipt payment method blank** for card/UPI (`pmodes:` tags).
5. **Repair pay-at-store ready email** shows final as "estimated" (`after-sales/index.js:1090`).
6. **Complimentary repair can be billed at completion** (₹0 final read as blank, `index.js:1031`).
7. **Balance payment link on a repair** has no handler after the estimate tags are stripped — no confirmation email (server.js:4331).
8. **Voucher-expiry guard is in memory** — restart re-sends, downtime skips.
9. **Repair wallet-refund vouchers print exchange-only terms 7–8.**
10. **Refund template** (Shopify) — logo left-align + fixed 600 width; replace before demo.
